This report focus on the feature implemented for part 3

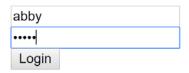

The first step is to insert all the tuple given for testing process.

Welcome to Finstagram

- <u>Login</u>
- Register

This is the main page. By clicking login button we get the next page.

Login

Because we have already insert the abby as a person tuple into the database, we can just by type the username and password stored in the table, which is in this case is abby and pass1

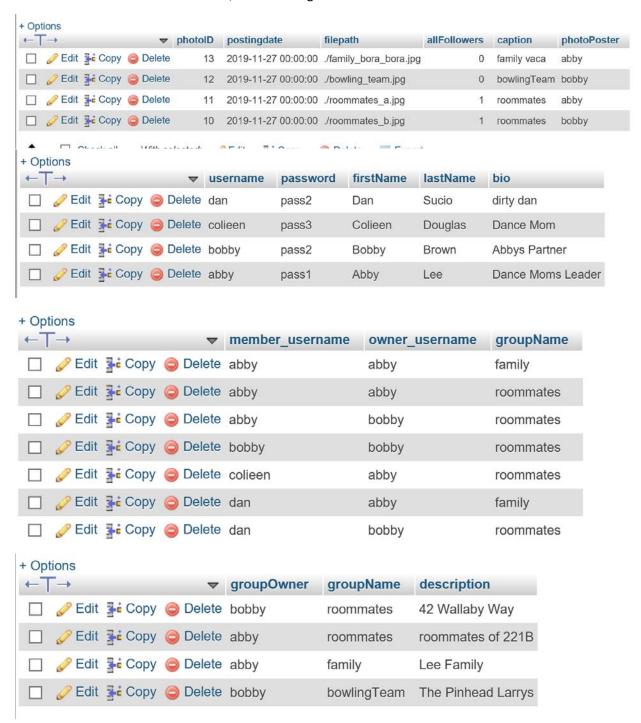

Hello, abby!

- View Images
- <u>Upload an Image</u>
- Follow user
- Logout

Owner of Phot	o PhotoID	Timestamp	Caption	Photo	People who have been tagged
abby	13	2019-11-27 00:00:00		./family_bora_bora.jpg	
bobby	12	2019-11-27 00:00:00		./bowling_team.jpg	
abby	11	2019-11-27 00:00:00		./roommates_a.jpg	
bobby	10	2019-11-27 00:00:00		./roommates_b.jpg	

After clicking the login in button we can get into our home page. In the home page, we can see all the photo visible to abby. In this case, the photoID which is visible for abby is 10, 11, 12, 13.

In order to show this feature is valid, we need to get information from all the table.

By showing the feature 1 is valid, I will explain the visible photo one by one.

- 1. As for photoID is 13, because the photoPoster is abby, this one is visible for abby
- 2. As for photoID is 11, because the photoPoster is abby, this one is also visible for abby
- 3. As for photoID is 12, we can see this one is not for all followers, but abby is belong to bobby's roommates group, and this photo is visible for bobby's roommates. Therefore, this one is also visible for abby.
- 4. As for photoID 10, we can see this one is visible for all follower, and abby is one of bobby's follower. Therefore, this one is also visible for abby.

The query to find visible photoID is shown below. Please take a look!

```
SELECT
photoID
          FROM photo
          WHERE photoID IN(
                SELECT photoID
                FROM photo
                WHERE photoPoster = 'abby'
                OR photoID IN(
                               SELECT photoID
                               FROM photo JOIN follow ON (photoPoster = username_followed)
                                WHERE (allFollowers = True AND username_follower = 'abby'
          AND followstatus = True)
                               OR photoID IN(
                                               SELECT photoID
                                                 FROM friendgroup AS F
                                                 JOIN belongto As B ON F.groupName =
          B.groupName AND F.groupOwner = B.owner_username
                                                 JOIN sharedwith AS S ON F.groupName =
          S.groupName AND F.groupOwner = S.groupOwner
                                                 WHERE member_username = 'abby')))
```
